

8std template + DQN (W1 baseline) enum + FRAP g/s (W2, proposed)

Tail-40 evaluation mean $\pm$ s.d. (fixed eval seed 123; s.d. = policy variability within the window, not across seeds). J(531) = $\sum$ flow-share $\times$ weight (amb 5 / bus 3 / car 1) $\times$ class stopped time (lower is better). Within each scenario the two arms differ only in the method package (phase set, network, observation layout).
